

Informational Commands

Erin Stellato

@erinstellato | www.SQLskills.com

What This Module Covers

Commands that provide information about different components of a SQL Server environment

Clearing instance-level information

Using Dynamic Management Objects (DMOs) vs. DBCC commands

DBCC SQLPERF

- Provides transaction log space usage for all log files on an instance
 - Useful for troubleshooting and baselining
- Can also be used to reset wait statistics, latch statistics, or spinlock statistics
 - Statistics can be reset on a regular basis (as part of baseline collection) or when troubleshooting
- Execution does not affect system performance
- Requires VIEW SERVER STATE to view log information, and ALTER SERVER STATE to reset statistics

DBCC SHOW_STATISTICS

- Displays statistics object for an index, indexed view, or column statistic
- Use when troubleshooting and understanding estimates from a plan (checking the histogram) and comparing against actual values
 - Review Kimberly Tripp's course *SQL Server: Optimizing Ad Hoc Command Performance*, notably Module 3 on *Estimates and Selectivity* for more information
- Viewing statistics does not introduce a performance load on the system
- Requires sysadmin, db_owner, or db_ddladmin roles, or table ownership

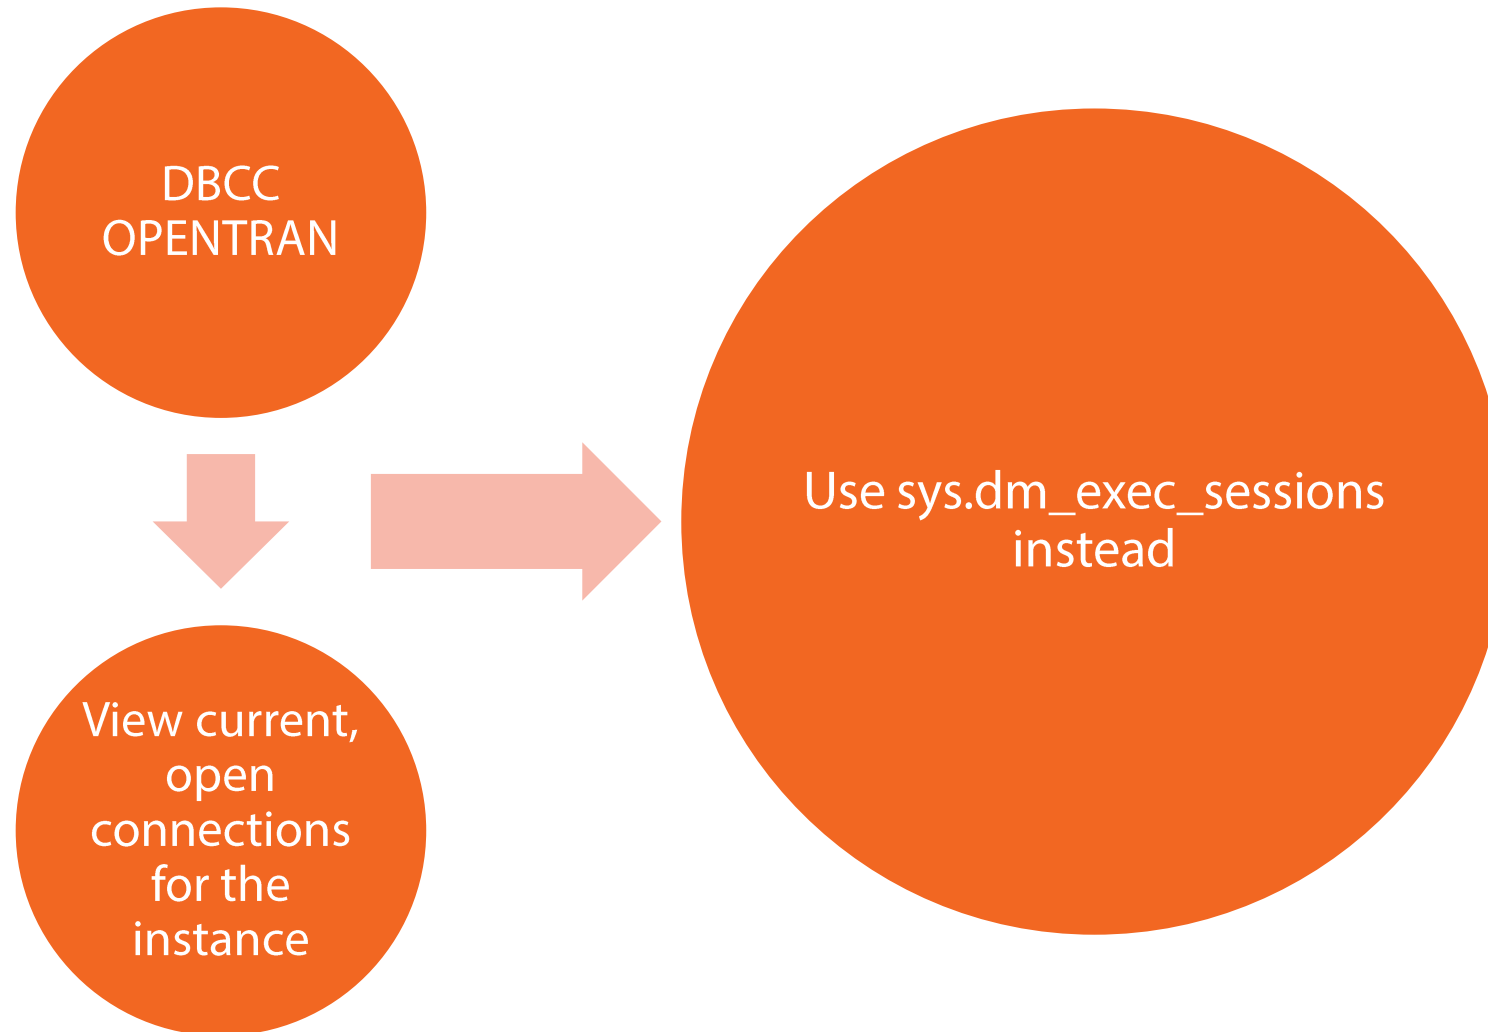

DBCC USEROPTIONS

- Returns options set for current connection
 - E.g., isolation level, QUOTED_IDENTIFIER
- Use to verify settings for a connection to confirm they are correct, or consistent across different connect methods (e.g., .NET application, ODBC, SSMS)
- Only displays information, does not modify settings
- Requires public role

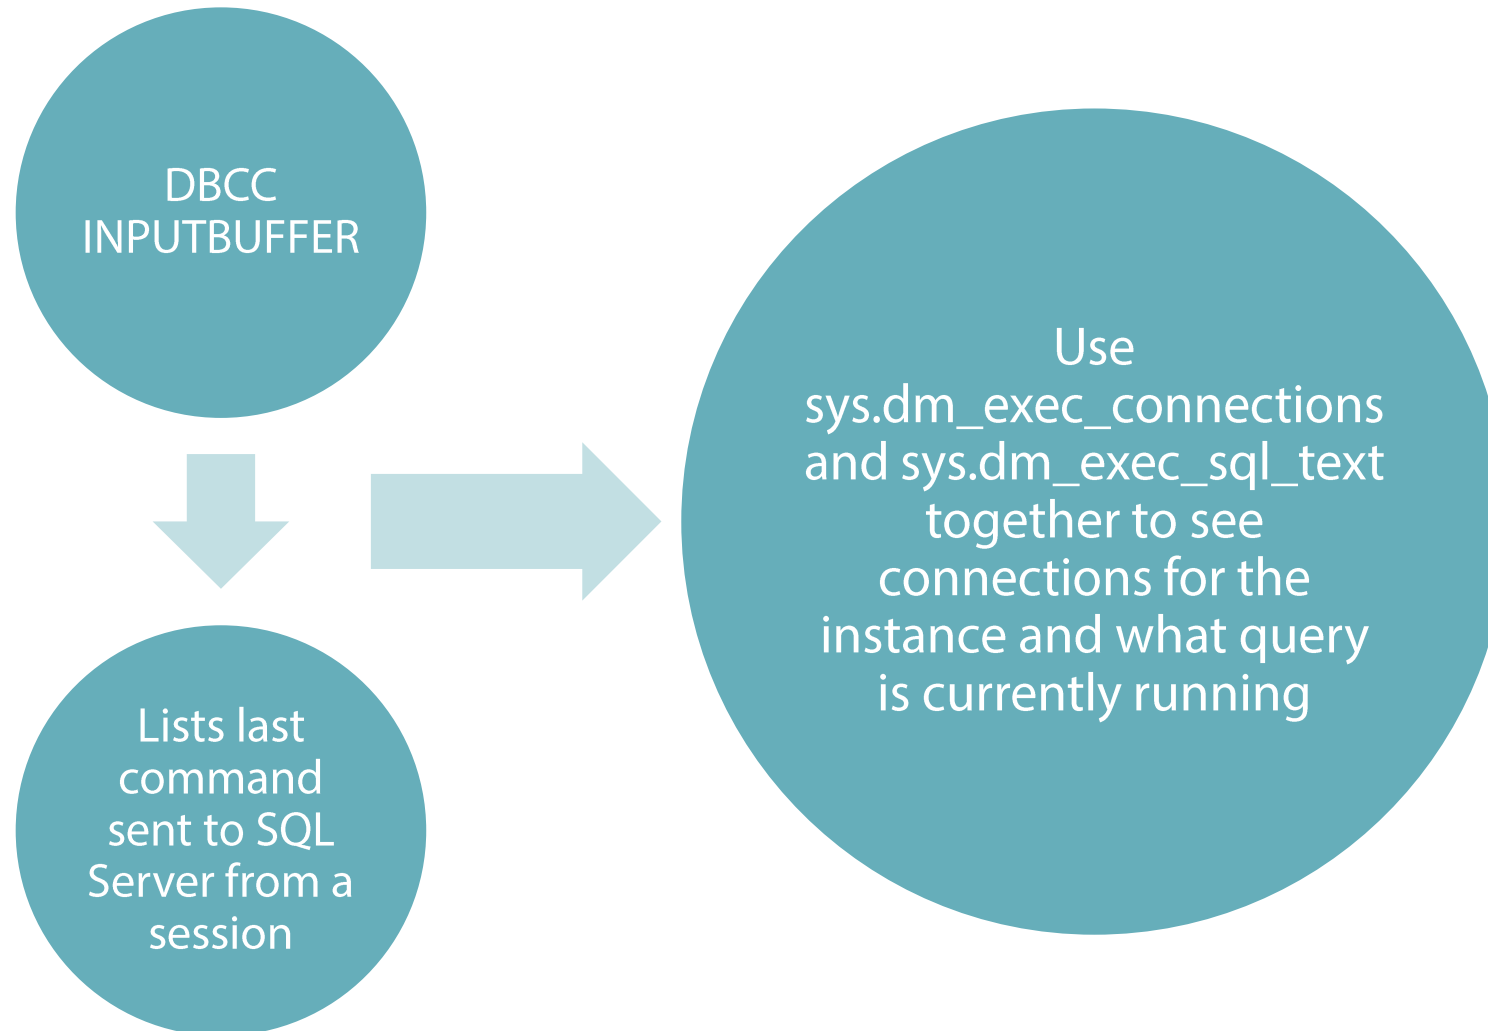

Additional Commands

- There are additional commands that provide information also found in the SQL Server Dynamic Management Objects (DMOs)
- Many of these commands have existed since SQL Server 2000 or earlier
- It is recommended to use DMOs instead of DBCC commands, as they can provide more comprehensive information

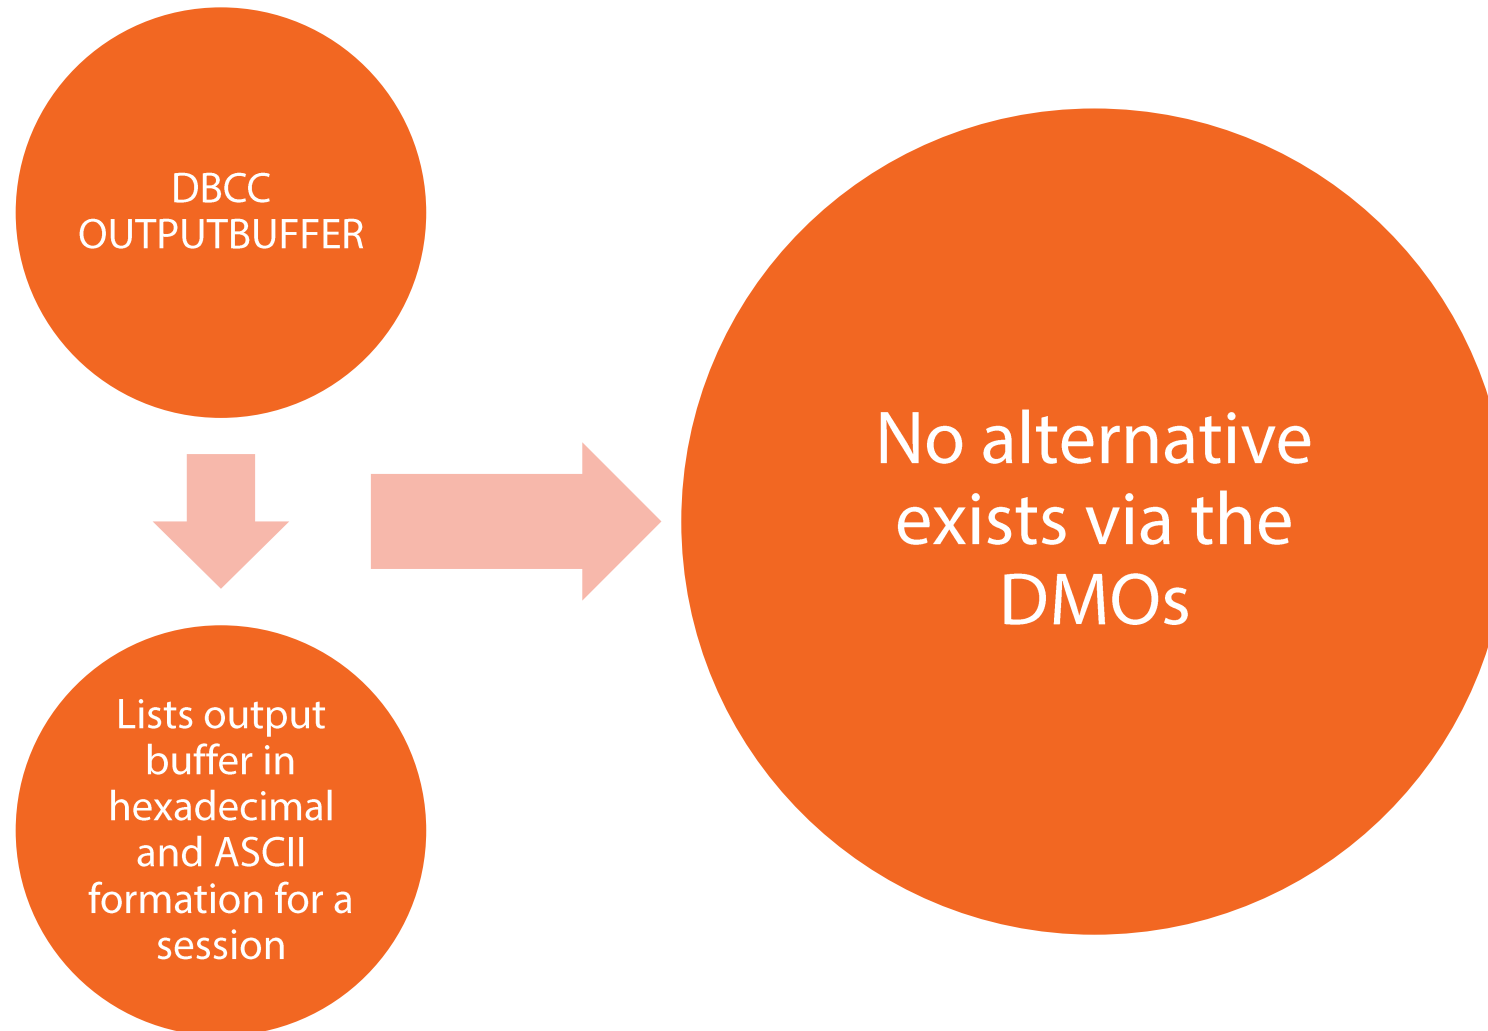

Additional Commands

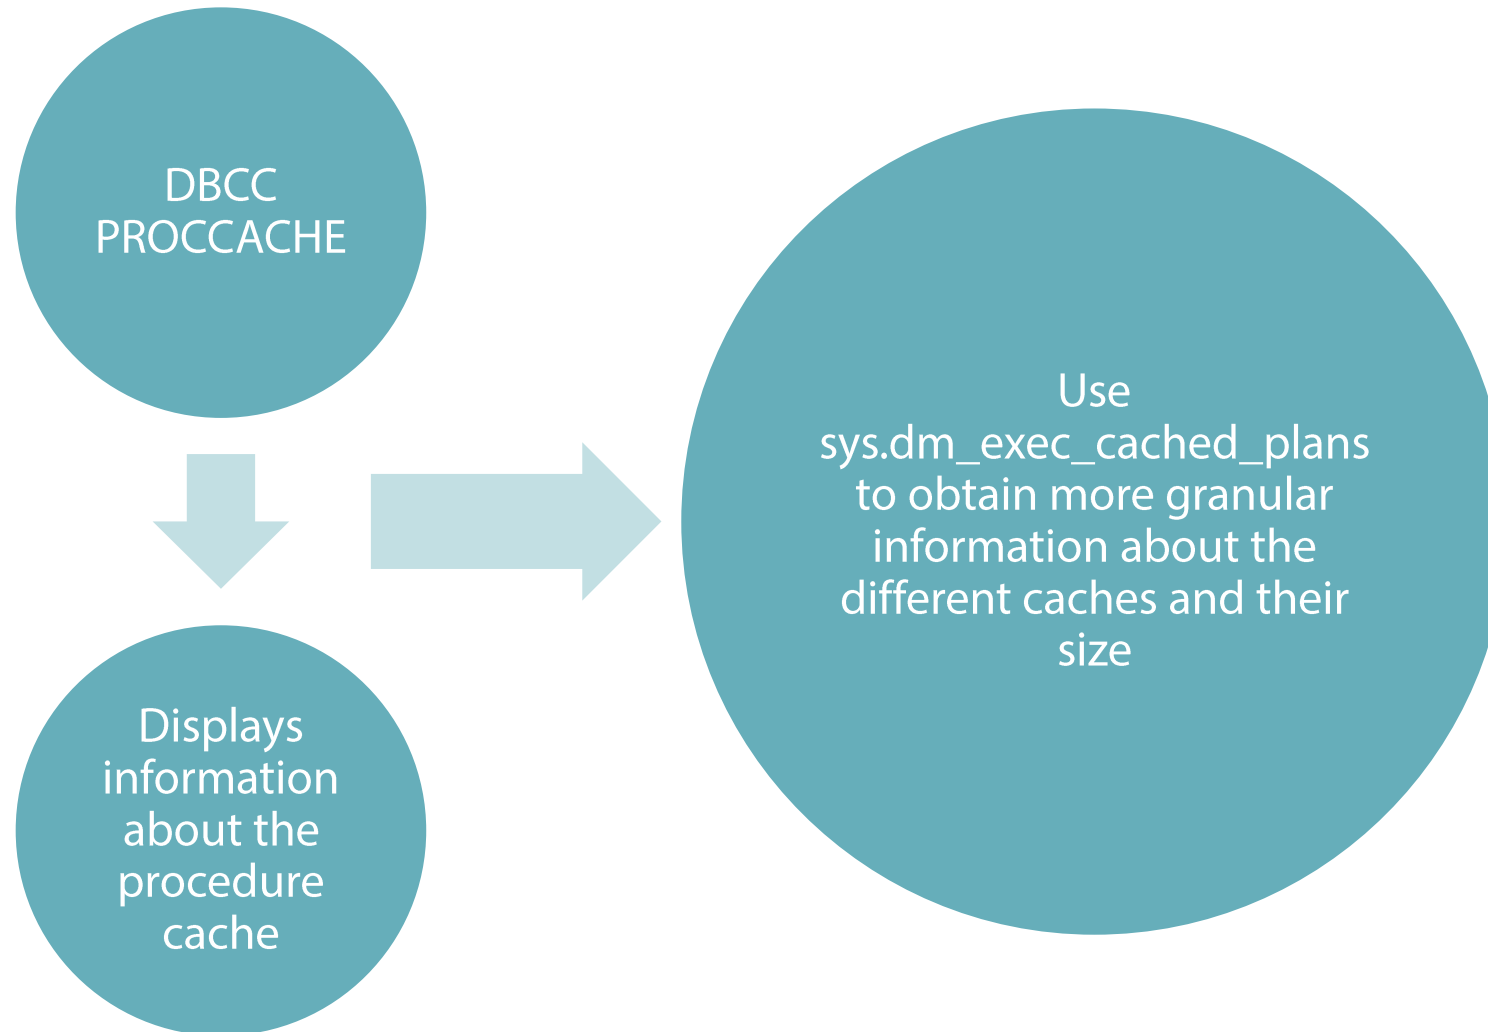

Additional Commands

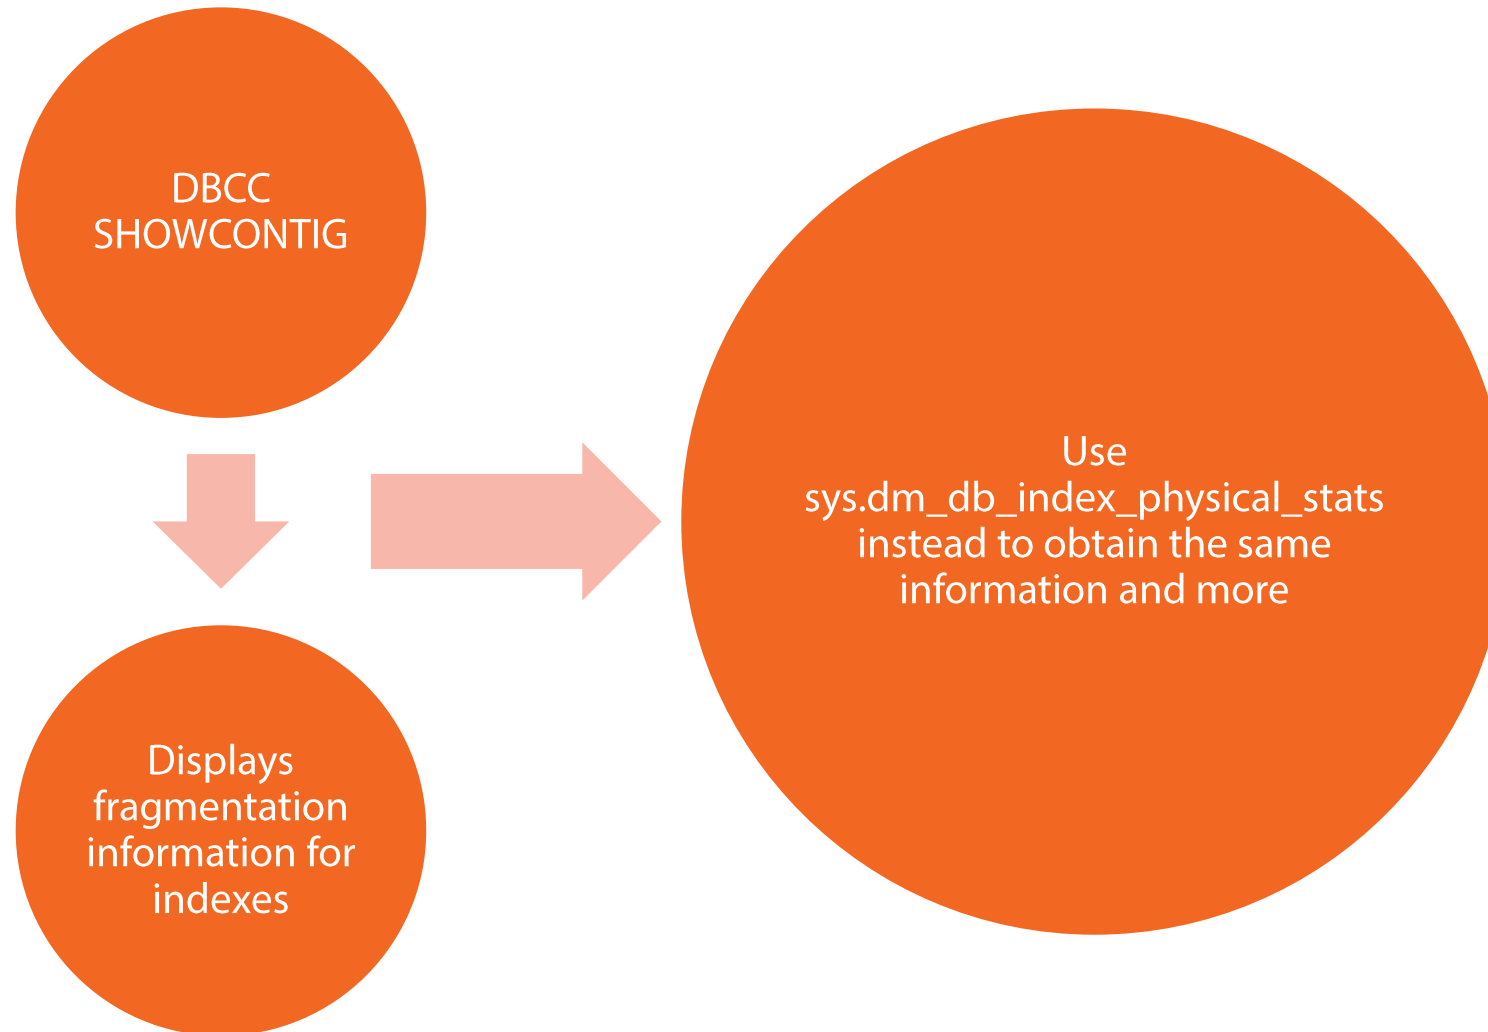

Additional Commands

Additional Commands

Using Informational Commands

Informational commands do not modify the SQL Server environment, nor do they affect system performance

Most commands have been replaced by DMOs, which provide more comprehensive output

What This Module Covered

Commands that provide information about different components of a SQL Server environment

Clearing instance-level information

Using Dynamic Management Objects (DMOs) vs. DBCC commands
